**Web Programming and Python (AI104)**

**Assignment – 5**

**1. Maximizing XOR**

Given two integers: **L** and **R**, Find the maximal values of **A xor B** given, **L** <= **A** <= **B** <= **R**

**Input Format:**

The input contains two lines, **L** is present in the first line. **R** in the second line.

**Constraints**

$1 \leq L \leq R \leq 10^3$

**Output Format:**

The maximal value as mentioned in the problem statement.

**Sample Input #00:**

1  
10

**Sample Output #00:**

15

**Sample Input #01:**

10  
15

**Sample Output #01:**

7

**Explanation**

In the second sample let's say **L**=10, **R**=15, then all pairs which comply to above condition are

10 xor 10 = 0  
10 xor 11 = 1  
10 xor 12 = 6  
10 xor 13 = 7  
10 xor 14 = 4  
10 xor 15 = 5  
11 xor 11 = 0  
11 xor 12 = 7

11 xor 13 = 6  
11 xor 14 = 5  
11 xor 15 = 4  
12 xor 12 = 0  
12 xor 13 = 1  
12 xor 14 = 2  
12 xor 15 = 3  
13 xor 13 = 0  
13 xor 14 = 3  
13 xor 15 = 2  
14 xor 14 = 0  
14 xor 15 = 1  
15 xor 15 = 0

Here two pairs (10,13) and (11,12) have maximum xor value 7 and this is the answer.

## 2. Halloween Party

Alex is attending a Halloween party with his girlfriend Silvia. At the party, Silvia spots a giant chocolate bar. If the chocolate can be served as only 1\*1 sized pieces and Alex can cut the chocolate bar exactly **K** times, what is the maximum number of chocolate pieces Alex can cut and give Silvia?

### Input Format:

The first line contains an integer T, the number of test cases. T lines follow.  
Each line contains an integer K

### Output Format:

T lines. Each line contains an integer that denotes the maximum number of pieces can be obtained for each test case.

### Constraints

$1 \leq T \leq 10$   
 $2 \leq K \leq 10^7$

### Note:

Chocolate must be served in size of 1\*1 size pieces.  
Alex can't relocate any of the pieces, not can he place any piece on top of other.

### Sample Input #00:

4  
5 6 7 8

### Sample Output #00:

6  
9  
12  
16

**Explanation:**

The explanation below is for the first two test-cases. The rest of them follow a similar logic.

For the first test-case where  $K=5$ , You need 3 Horizontal and 2 Vertical cuts.

For the second test case where  $K=6$ , You need 3 Horizontal and 3 Vertical cuts.

**3. Bigger is Greater**

Given a word  $w$ , rearrange the letters of  $w$  to construct another word  $s$  in such a way that  $s$  is lexicographically greater than  $w$ .

**Input Format:**

The first line of inputs contains  $t$ , number of test cases. Each of the next  $t$  lines contains  $w$ .

**Constraints:**

$$1 \leq t \leq 10^5$$

$$1 \leq |w| \leq 100$$

$w$  will contain only lower-case English letters and its length will not exceed 100.

**Output Format:**

For each test case, output a string lexicographically bigger than  $w$  in a separate line. In case of multiple possible answers print the lexicographically smallest one and if no answer exists, print **no answer**.

**Sample Input:**

```
3
ab
bb
hefg
```

**Sample Output:**

```
ba
no answer
hegf
```

**Explanation:**

**Testcase 1:** There exists only one string greater than ab which can be built by rearranging ab. That is ba.

**Testcase 2:** Not possible to rearrange bb and get a lexicographically greater string.

**Testcase 3:** hegt is the next string (lexicographically greater) to hefg.
